

Community Adaptation Decision Making Exercise

This exercise explores the diversity in climate change impacts across different community contexts, and uses these differences to plan for future adaptation.

Participants will be grouped according to hypothetical communities and, based on the community profiles provided, will identify climate risks to these communities and suggest the best ways to address them. All materials can be found in the **Community Adaptation Decision Making Exercise** folder of Day 7.

Each Community will answer the following questions:

1. State up to 3 climate variables which are important to your community. Why are they important?
2. Select 3 impact tables from those provided that would apply to your organization or community:
 - How would this information guide short and long term planning in your community?
3. Propose one possible long term project that you could implement in your community to adapt to potential climate impacts and specify at least one objective.

Presentations will be made using the **Community Adaptation Activity Template** provided.
