

## Special Issue on Health Sciences

MA Ashraf

It is a pleasure to introduce this special issue on health sciences. Health science is one of the fastest emerging fields in health. Remarkable advancements have been made in the field of medical, nursing and allied health sciences since the past 10 years. This has influenced life expectancy and resulted in better health management and improved treatment; its impact can even be seen in the health policies of governments in different countries. The health safety of any developing and developed nation can be evaluated through the level of advancement of health. The rate of advancements in medical, dental, nursing and the allied health sciences field is so enormous that it takes time to properly know about their applications. Therefore, I encourage researchers to publish research and studies in the

fields of public, community, environmental and behavioural health as well as in the fields of health policy, health service, health education, health economics, medical ethics, health protection and equity in their particular nation. Just like the whole field of health sciences, the subjects in this issue are also strongly interdisciplinary. All manuscripts range in focus from medical science, public health, community health, environmental health, behavioural health, quantum computing to neural science.

I would like to thank West Indian Medical Journal who provided the opportunity to publish this special issue. We hope you will find those presented thoughts and results inspiring when you read this issue.
